#	Description of Change
1	Modified: New Logo and Tag Line
2	Added: Sustainability Terms & Definitions

Associated Documents Approval & Issue

Related Document/ Record	Initiated by	Reviewed by	Checked/ Verified / Approved by

Auditee	Location (field/ site) to be or being audited.
Auditor	Competent person who conducts an HSE audit.
Audit Conclusion	Outcome of an audit, after consideration of the audit objectives and all audit findings.
Audit Criteria	Set of policies, procedures or requirements used as a reference against which audit evidence is compared.
Audit Evidence	Records, statements of fact, or other documented information (qualitative or quantitative) which are relevant to the audit criteria and verifiable.
Audit Findings	Results of the evaluation of the collected audit evidence against audit criteria. The findings include good practices, nonconformities, observations or opportunities for improvement.
Audit Grade	Audit Grade for a specific location (attributed as Excellent, Good or Poor) is based upon percentage compliance level determined by Audit Team against the Standardized HSE Audit Checklist.
Audit Plan	Arrangements for an audit planned (as per audit planner/ schedule) for a specific time frame and directed towards a specific purpose.
Audit Planner (Schedule)	Audit program arrangements for a set of audits scheduled for a specific time period and directed towards specific purpose.
Audit Scope	Extent and boundaries of an audit; It generally includes a description of the physical locations, organizational units, activities and processes, as well as the time period covered.
Audit Team	One or more HSE Auditors conducting an audit, and supported by technical or subject matter experts, if needed.
Documented Information	Documented information, refers to any information required to be controlled & maintained. (It can be in any format/ media, and from any source.)
Lead Auditor	An experienced HSE Auditor of the Audit Team who is appointed as Team Leader for a specific audit.
Objective Evidence	Records, statements of fact, or other documented information (qualitative or quantitative) supporting the existence or verity of something obtained through observation, measurement, test, or other means.

EMERGENCY PREPAR	EDNESS AND RESPONSE
Active Fire Protection Systems	Active fire protection refers to systems that involve a triggered response to a fire. Active systems are initiated by the flame and the response may be manual (for example, a hand operated fire extinguisher qualifies as an active response) or programmed (for example, a sprinkler system). Essentially, active fire protection involves fighting a flame. These systems are considered to be a proactive approach to extinguishing fires and controlling the spread of smoke. The following list of examples are all a part of active fire protection: Fire extinguishers Fire hose reels Fire blankets Sprinkler systems Smoke alarms Firefighters/ emergency services Automated fire doors Thermal detectors Fire control systems
Contingency Plan	A pre-established plan to mitigate an unusual situation which has potential for harm, which incorporates the best use of local as well as remote facilities and resources.
Crisis Management Teams	 a. Emergency Management Team (EMT), Head Office b. Location Emergency Management Teams (LMTs) i. Rapid Response Team (RRT) ii. Emergency Response Team (ERT) iii. First Aid & Evacuation Team
Emergency Level-1	An emergency that can be controlled by the localized action at the affected area by the available personnel and resources. This level of emergency doesn't have immediate serious injuries, potential of fatality, major equipment loss, major loss of primary containment, large fire/explosion, major vehicular incident and/or major environment impact. • Emergency siren is NOT sounded at this stage. • Mustering is NOT required. • LMT is NOT activated; however, the situation is critically monitored by Location InCharge (Chairman LMT) for assessment of any further escalation potential.

	Work activities can be suspended temporarily in the localized area which is or likely to be affected.								
Emergency Level-2	An emergency situation which has potential to impact the affected site significantly and for which external support services may be required. It may result in serious injuries/ fatality, major equipment damage, major loss of primary containment, significant fire/ explosion, major vehicular incident, and/ or loss of controlled substance to the environment • Emergency siren is sounded with intermittent tones of 10 seconds each with 5 seconds pause, repeated 3 times. Where available, emergency announcement through Public Address system may also be made. Emergency termination would be managed through siren with continuous tone for 120 seconds. • Mustering is required. However, LMT Chairman may further decide to evacuate to the Assembly Points designated outside the main gate. Employees are to wait for further instructions there. • LMT is activated; however, EMT may be activated depending upon crisis level (severity) 3, 4, or 5 • All operations/ activities will be stopped.								
Emergency Response Post	An operations centre established in a suitable location to manage the larger aspects of the emergency. In a high-impact emergency there may be a number of response posts established to support the response like any joint off-site regional response post, provincial government's response post, etc.								
Emergency Planning Zone (EPZ)	An area surrounding a facility, pipeline, or well where personnel, residents or other members of the public may be at highest risk during the early stages of an uncontrolled release of toxic materials such as H2S or explosion or fire and the area for which the company must have a specific emergency response plan.								
Emergency Response Plan (ERP)	A comprehence of the communication of the event	assessing esponse ations ar	an eme personn Id coord	rgency s el and a	ituation gencies	and products	cedures t ablishing	for

Poccupan ve comp facility c	g ignition ned to assive fire ts and fo partments and ensur	in the first e or the alization, re the safe	

	Spray fireproofing
Retrieval System	The equipment used for non-entry rescue of persons from confined spaces such as a safety harness and life line.
Spill Volume (Reportable)	Quantity of spills equal to or more than one barrel i.e. 159 liter of crude, refined products, and chemicals both on land and aqueous environment.
T-Card & Mustering System	Manual Card for the personnel to sign or swipe in and out of the plant areas used for tallying up all the personnel that have assembled at the different "Muster Points" during actual emergencies or mock drill sessions in order to check whether this equates to the total number of people on the entire plant.
HSE PERFORMANCE I	(PIs
Fatal Accident Frequency Rate (FAFR)	(Number of Fatalities due to work related injuries in a year / Total man hours) x 1000,000

	in order to check whether this equates to the total number of people
	on the entire plant.
HSE PERFORMANCE K	Pls
Fatal Accident Frequency Rate (FAFR) [Corporate]	(Number of Fatalities due to work related injuries in a year / Total man hours) x 1000,000
Fatal Accident Frequency Rate (FAFR) [Unit Level]	(Number of Fatalities due to work related injuries in a year / Total man hours) x 2000,000
First Aid Case (FAC)	An injury that requires simple treatment, such as cleaning and application of a small bandage, which does not require treatment by a medical professional.
Heinrich (Safety Triangle) Ratio	29 Minor Injuries MINOR INJURY MINOR INJURY MINOR MISS NEAR MISS UNSAFE ACT
Key Performance Indicator (KPI)	Performance indicator or key performance indicator (KPI) is a measure of performance commonly used to help an organization define and evaluate how successful it is, typically in terms of making progress towards its specific goals.
Lagging Indicators	Lagging indicators are typically "output" oriented, easy to measure but hard to improve or influence e.g. incidents related statistics, pollution load, etc.
Leading Indicators	Leading indicators are typically "input" oriented, hard to measure and easy to influence e.g. risk assessment reports, audit results, trainings outcome, etc.
Lost Workday (Time) Injury Frequency (LWIF or LTIF) [Corporate]	(No. of Fatalities + No . of Lost Time Injuries in a year / Total Hours Worked) x 1,000,000
Lost Workday (Time) Injury Frequency (LWIF or LTIF) [Unit Level]	(No. of Fatalities + No . of Lost Time Injuries in a year / Total Hours Worked) x 200,000
Medical Treatment Case (MTC)	An injury severe enough to require treatment by a medical practitioner (a physician or nurse), but does not cause the worker to miss any work.
Restricted Workday Injury (RWI)	An injury that restricts the worker from performing his normal duties but to continue within 24 hours of the injury.
Safe Man Hours	Cumulative hours worked since the most recent Lost Workday (Time) Injury (LWI or LTI) took place in a certain site or location.
Total Reportable (Injury) Cases	Restricted Workday Injuries + Lost Workday Injuries + Medical Treatment Cases

Process Safety Pyramid	
	Tier 1 PSIs - LOPC
	Events of Greater Consequence
	(e.g, involving > TQ, DAWC, Community Impact)
	Tier 2 LOPCs - Events of lesser significance (e.g., 10% PSI TO, RWC, RWTC) [failures which could have led to a PSI]
	Tier 2 LOPCs - Events of lesser significance (e.g., 10% PSI TO, RWC, RMTC) [failures which could have led to a PSI] Tier 3: Process Upsets, Reliability Events,
	(e.g., 10% PSI TQ, RWC, RMTC) [failures which could have led to a PSI]
	Tier 3:
	Process Upsets, Reliability Events,
	Shutdowns and Challenges to Safety Systems [failures which could have led to an Tier 1 or 2 incident]
	Tier 4
	Operating Discipline & Management System Heath Indicators [Code of Conduct Expectations – Design, Operations, Maintenance]

regulation.
There are two kinds of compliance obligations: mandatory compliance obligations and voluntary compliance obligations. Mandatory compliance obligations include laws and regulations while voluntary compliance obligations include contractual commitments, community and industry standards, ethical codes of conduct, and good governance guidelines. A voluntary obligation becomes mandatory once you decide to comply with it.
An organization's context is its business environment. It includes all of the issues, factors, and conditions that could influence or be influenced by its HSE Management System.
A confined space is a place which is substantially enclosed (though not always entirely), and where serious injury can occur from hazardous substances or conditions prevailing within the space or nearby (e.g. lack of oxygen) i.e. exists with IDLH conditions.
A confined space which normally exists without IDLH conditions. Non-hazardous confined spaces are floating roof tank tops, tower skirts, sunken valve and pump manifold areas, cooling tower cells, and fin fans.
Seeking views for decision-making.
A chemical that causes visible destruction of, or irreversible alterations in, living tissue.
Mathematical computerized simulation of how air pollutants disperse in the ambient atmosphere. The dispersion models are used to estimate the downwind ambient concentration of air pollutants or toxins emitted from sources such as industrial plants, vehicular traffic or accidental chemical releases. They can also be used to predict future concentrations under specific scenarios (i.e. changes in emission sources).
A dead man's switch is a switch that is automatically operated if the human operator becomes incapacitated, such as through death, loss of consciousness or being bodily removed from control.
Information required to be controlled and maintained by an organization and the medium on which it is contained; Documented information can be in any format and media and from any source.
Due diligence means that employers shall take all reasonable precautions, under the particular circumstances, to prevent injuries or accidents in the workplace. Reasonable precautions are also referred to as reasonable care. It refers to the care, caution, or action a reasonable person is expected to take under similar circumstances. Also check ALARP.
Occurrence of a particular set of circumstances.
Surroundings in which an organization operates, including air, water, land, natural resources, flora, fauna, humans and their interrelations.
Element of an organization's activities, products or services that can interact with the Environment; A significant environmental aspect has or can have a significant environmental impact.
Any change to the environment, whether adverse or beneficial, wholly or partially resulting from an organization's environmental aspects.
To accelerate the time to first oil and gas, production is started early while full field development is being planned and permanent facilities are being built. Early-production Facilities (EPF) help operators bring their new discoveries on-stream fast.
The science of studying people at work, and designing tasks, jobs, tools, equipment, facilities, and the work environment so that people can be safe, healthy, effective, efficient, productive and comfortable.
A chemical that causes a sudden, almost instantaneous release of pressure, gas or heat when subjected to sudden shock, pressure or high temperature.
The measurement of time during which the subject is at risk from vulnerability (hazard).
Front-End Engineering Design (FEED) is an engineering design approach used to control project expenses and thoroughly plan a project before a fix bid quote is submitted. It may also be referred to as Pre-project planning (PPP), front-end loading (FEL), feasibility analysis, or early project planning.

HSE Management Review Committee	HSE Management Review Committee consists of Squarterly to seek & analyze Performance of HSE Sy	
(MRC) HSE Management System	Targets and plan ahead accordingly. The part of the overall management system that is structure, planning activities, responsibilities, pract	ices, procedures,
	processes, and resources for developing, implementations and maintaining the HSE policy.	
HSE Objective	Overall HSE goal, arising from the HSE policy, that itself to achieve, which is quantified where practic	cable.
HSE Performance	Measurable results of the HSE management system organization's control of its HSE aspects, based on objectives and targets.	
HSE Plan	A description of the means of achieving HSE objectincludes set of HSE Monitoring Plans; HIRA Plan; EmTraining Plan; Waste Disposal Plan; Emergency Res	nergency Drills Plan;
HSE Policy	Statement by the organization of its intentions and to its overall HSE performance which provides a fround for the setting of its HSE objectives and target	d principles in relation amework for action
HSE Target	Detailed performance requirement, applicable to parts thereof, that arises from the HSE objectives a set and met in.	the organization or
Immediately Dangerous to Life and Health (IDLH)	Any condition that (a) poses an immediate or deleter (b) would cause an irreversible adverse health effinterfere with an individual's ability to escape una space. The level of contaminant that would pose	ect; or (c) would ided from a confined
Inerting	is substance specific. The displacement of an atmosphere in a confined noncombustible gas such as nitrogen, to such an resulting atmosphere will not support combustion results in an IDLH (oxygen deficient) atmosphere. entries are not normally done by company persor	extent that the or life. This condition Inert confined space
In-Service Welding	The hazardous practice of welding on equipment vessel, exchanger, etc.) which has not been purginot been removed from service through conventincludes but is not limited to grinding, burning or w	(e.g., tank, pipe, ed (gas free) and has onal methods. This
Interested Party	Individual or group concerned with or affected by of an organization.	
Irritant	A chemical that causes reddening, swelling and parties tissue damage. Irritants are not corrosive. Their influences reversible.	
Job Vulnerabilities /	The process of carefully studying and recording ed	ach step of a job
Hazard Analysis (JVA / JHA)	identifying existing or potential job vulnerabilities / and health), and determining the control measure eliminate the impact.	hazards (both safety
Journey Management	The planned movement of people and equipmer another place including communications, route, swarnings, provisioning, breakdown and other con	schedule stops, hazard
Just Cause	Good or fair reason(s) for discipline.	
Lifecycle	It refers to the consecutive and interlinked stages from the acquisition of materials to end-of-life dispincludes all associated activities, products, and se include procured materials and services as well as decommissioning, and disposal.	oosal. The E&P lifecycle rvices and may
Line Break	The intentional opening of a process system that reflammable, corrosive, or toxic material or a material temperature such that an unplanned opening of in injury to workers. Examples include spreading flexchangers, pulling pumps, cold cutting pipe, etc depending on equipment used, could be cold workers.	ial under pressure or the system may result anges, opening . Line break,
Life Cycle Perspective	A life cycle perspective includes consideration of (threats & opportunities) of an organization's reser activities, products, and services that it can control in a life cycle include acquisition of raw materials, transportation/delivery, use, end of life treatment,	the HSE vulnerabilities voirs, materials, of or influence. Stages design, production,
Light Intensity	To assess whether lighting is sufficient in workplace intensity ranges are used. Employees should unde lighting on their health and safety. In particular, th understand visual fatigue: its causes, prevention, s recovery techniques.	e, following light rstand the effects of ey need to
	Task/ Area	Range of Luminance (Lux)

	Emergency lighting (at floor or tread levels) in exits, exit routes, stairs, and underground	At least 10
	walkways Simple visual tasks e.g. lobby area; washrooms;	(on average)
	loading into trucks Medium visual tasks e.g. bookkeeping; filing;	30 – 100
	material receiving and packing areas More visually demanding tasks e.g. QC/	300 – 1000
	inspection; proofreading; workshops/ machine work	3000 – 10000
Mounted Enclosure	Small enough to prevent complete physical entry junction box, analyzer enclosure, etc.).	(e.g., cabinet,
Non-Pressurized Building Containing Enclosure(s)	Building containing purged or pressurized equipment (e.g., analyzer building, blend building, etc.)	
Outsource	When an organization makes an arrangement with an outside organization to perform part of a function or process, it is referred to as outsourcing. To outsource means to ask an external organization to perform part of a function or process normally done in-house.	
Oxidizer	A chemical that initiates or promotes combustion in other materials causing fire through the release of oxygen or other gases.	
Participation	Involvement in decision-making.	
PDCA Cycle	PDCA (Plan–Do–Check–Act or Plan–Do–Check–Adjust) an iterative four-step management method used in business for the control and continuous improvement of processes and products. It is also known as the Deming Wheel, Shewhart Cycle, Control Circle/Cycle, or Plan–Do–Study–Act (PDSA).	
Permit to Work (PTW) System	A permit-to-work system is a formal written system used to control certain types of work that are potentially hazardous. A permit-to-work is a document which specifies the work to be done and the precautions to be taken. Permits-to-work form an essential part of safe systems of work for many maintenance activities. They allow work to start only after safe procedures have been defined and they provide a clear record that all foreseeable vulnerabilities / hazards have been considered.	
Personal Protective Equipment (PPE)	Category A: Basic PPE i.e. a) Coverall / Dangri, b) Warm Jacket / Leather Jacket, c) Safety Shoes, d) Safety Glasses, e) Hard Hat, f) Ear Muffs and g) Cotton Gloves. Category B: Specific PPE i.e. a) Gloves (Leather, Chemical Resistant, and Latex), b) Face Shields (Welding Shields and Goggles), c) Flame Resistant Clothes, d) Long Safety Shoes, e) Gas Mask, f) Chemical Apron and f) Safety Harness. Category C: Emergency PPE i.e. complete Turnout Gear/Fire Kit (Fire Suit), SCBA, Air Purifying Respirator (APR), and Safety Vests/Clothing with Reflective Material designed for high nighttime visibility.	
Prevention of Incidents	Use of processes, practices, materials or products that avoid, reduce or control incidents, which may include engineering (design) controls, reduction of hazards/ risks, isolation of hazards/ risks, administrative controls and use of PPE.	
Prevention of Pollution	Use of processes, practices, materials or products that avoid, reduce or control pollution, which may include recycling, treatment, process changes, control mechanisms, efficient use of resources and material substitution.	
Pressurized Building Containing Pneumatic Controls	Pressurized building containing control equipment to release purged air (e.g., pressurized control roo	
Process Safety Information (PSI)	Physical, chemical, and toxicological information chemicals, process, and equipment. It is used to configuration of a process, its characteristics, its lir for process hazard analyses.	document the

Process Safety & Risk		
Management (PSRM) Model	MANAGEMENT COMMITMENT	
	Motivation & awareness Motivation & awareness Motivation & awareness Motivation & processibility All anagement of the process should be all anagement of the process shoul	
Process Hazard Analysis (PHA)	A process hazard analysis (PHA) (or process hazard evaluation) is a set of organized and systematic assessments of the potential vulnerabilities (threats / hazards) associated with an industrial process. The techniques include Checklist; What-If; Hazld; HazOp; Process Hazards Review (PHR); Failure Modes Effects and Analysis (FMEA); Layers of Protection Analysis (LOPA).	
Product Safety Data	SDS when prepared by the relevant team for our own products.	
Sheet (PSDS) Pyrophoric	A chemical that will ignite spontaneously in or at a temperature of 103 F	
	(54.4 C or below).	
Reproductive Hazards	Chemicals that affect the reproductive capabilities of males, females and a developing fetus. Reproductive (M) – for males Reproductive (F) – for females Reproductive (D) – developmental hazard for fetus Reproductive (S) – suspect, effects seen at levels not expected in industry	
SDS	Safety Data Sheet which refers to the purchased material.	
Sensitizer	(also called PSDS in case of selling of the material). A chemical that causes a substantial proportion of exposed people or animals to develop an allergic reaction in normal tissue after repeated	
Short Term Exposure Limit (STEL)	exposure to the chemical. The maximum permissible concentration of a material, generally expressed in ppm in air, for a defined short period of time (typically 5 or 15 minutes, depending upon the country). This "concentration" is generally a time-weighted average over the period of exposure. These values, which may differ from country to country, are often backed up by regulation and therefore may be legally enforceable.	
Simultaneous Operations (SIMOPS)	Simultaneous operations means different operations carried out by different teams or companies in same location with possibilities of impacts or interferences between substances, material or personal which can cause undesirable circumstances.	
Toolbox Talk Program	Toolbox talks are a program developed by OGDCL to bring a HSE culture into its working environment. Instead of lengthy, somewhat rigid formal training sessions, employees take part in a 10-15 minute relaxed safety briefing. These talks take place directly in the workplace, whether it be a manufacturing floor or at a construction site.	
Unstable (Reactive) Chemical	A chemical that reacts with water to release a gas that is either flammable or presents a health hazard.	
Vesicant	A chemical which, if it can escape from the vein, causes extensive	
	tissue damage, with vesicle formation or blistering.	

OQ) (** Terms & Definitions: OGDCL's Integrated HSE System Manual

Controlled Copy Do Not Duplicate For Internal Use Only

Walk-in Enclosure	Similar to mounted enclosure, but large enough to allow complete physical entry (e.g., walk-in compressor control equipment).	
Workplace	A workplace is a place where an organization's work is performed. A place is an organization's workplace only if it is under its control, at least to some extent.	
Worker	Person performing work or work-related activities that are under the control of the organization.	
Xenobiotic	A chemical (or, more generally, a chemical mix) which is not a normal component of the organism which is exposed to it. Xenbiotics, therefore, include most drugs (other than those compounds which naturally occur in the organism), as well as other foreign substances.	

INCIDENT INVESTIGATION **Bowtie Diagram** A 'bowtie' is a diagram that visualizes the risks and multiple plausible scenarios in an easy to understand picture. The diagram is shaped like a bow-tie, creating a clear differentiation between proactive and reactive risk management. EF Barrier This is an activity in a work environment (as a condition of employment **Controlled Activity** i.e. physical location, equipment, material or vehicle) related to OGDCL workforce member where OGDCL can set HSE policies, standards and procedures (PSP) and directly supervise and enforce its application. Incidents arising from controlled activities are reported, investigated and tracked. **Continual improvement** Process of enhancing the HSE management system to achieve improvements in overall HSE performance in line with organization's HSE policy. **Contributing Surface** Major but not the root level cause of an incident (implicating or has Cause potential to implicate) an injury or illness e.g. in case of a fall from a ladder contributing surface causes may be a) slippery floor, chemical leak, broken valve and/or untrained worker indicating unsafe condition and b) person did not inspect, ignored the vulnerability (hazard), failed to report the vulnerability (hazard) and/or himself created the vulnerability (hazard) indicating unsafe behavior. **Corrective & Preventive** An HSE System Tool/Form for continuous improvement to timely Action Request (CPR) document an issue or an emerging issue to enable focus on systematic investigation of discrepancies (violation, failures and/or deviations) in an attempt to prevent their recurrence (for corrective action) or to prevent occurrence (for preventive action). **Design Root Cause** Root level cause of an incident (implicating or has potential to implicate) an injury or illness e.g. in case of a fall from a ladder primary surface causes may be a) nonexistence of maintenance plan, flawed inspection plan and/or nonexistence of implementation strategy indicating unsafe condition and b) failing to provide tools, inadequate supervision, non-enforcement of rules and/or inconsistent training of the person indicating unsafe behavior. Readily identifiable event with potential to cause an accident or Dangerous Occurrence disease to persons at work and the public or of significant actual or potential material damage. (Also see Near Hit.) **Fatality** Death of workforce member caused by a work related incident, regardless of the time intervening between injury and death. First Aid Case Work related injuries or illnesses that involve a single treatment of minor bruises, cuts, burns, scratches etc. and not requiring medical care of the level to take the patient to the Hospital. This includes injuries / illnesses that require minor treatment, e.g. any one-time treatment, cleansing, application of bandages / band-aids, treatment of minor scratches, cuts, burns, splinters, etc. **Line Of Fire Injuries** Line of fire injuries occur when the path of a moving object or the release of hazardous energy (to be taken as a harms-way) intersects

Layers of Protection	with an individual's body. A method used to evaluate high-consequence scenarios determining	
-	· · · · · · · · · · · · · · · · · · ·	3 11
Analysis (LOPA)	the combination of probability of occurrence and severity of	
	consequences meets a company's risk tolerance.

Loss of Primary	An unplanned or uncontrolled release of any material from primary	
Containment (LOPC)	containment, including non-toxic and non-flammable materials (e.g.	
,	steam, hot condensate, nitrogen, compressed CO2 or compressed a	
Lost Workday (Time)	A work related injury or illness which results in the OGDCL's or	
Injury (LWI o LTI)	contractor's workforce member declared medically unfit to attend	
injory (EWI O EII)	duty on the next calendar day (24 hrs) after the day of injury. The	
	criteria "24 hours" include rest days, weekend days, scheduled holiday	VC
		15,
	public holidays or subsequent days after ceasing employment;	1.
	However, if medical practitioner declares that the injured person is fit	TO
	attend office within 24 hours, then the injury shall <u>not</u> be LWI or LTI.	
Monitored Activity	This is an activity where OGDCL can influence but cannot set HSE	
	policies, standards and procedures (PSP) and cannot directly supervise	se
	and enforce its application. Incidents arising from monitored activities	S
	are reported, investigated (where possible) and tracked.	
Near Hit/ Near Miss	An unplanned event that do not result in injury, illness, or damage – be	ut
	has the potential to do so. Only a fortunate break in the chain of ever	
	prevents an injury, fatality or damage. Human error is commonly an	
	initiating event, a faulty process or system invariably permits or	
		ır
	compounds the harm, and is the focus of improvement. Other familiar	
	terms for these events is a "close call", "dangerous occurrence", or in	i
	the case of moving objects, "near collision".	
Occupational Health	Any illness suffered due to occupational matter like Noise Induced	
Illness	Hearing Loss, Food Poisoning, Musculoskeletal Disorder, etc.	
Opportunity	A circumstance or a set of circumstances that could lead to the	
	improvement of HSE performance.	
Medical Treatment	An injury severe enough to require treatment by a medical practition	er
Case (MTC)	(a physician or nurse), but does not cause the worker to miss any work	ĸ.
Permanent Partial	Any work related injury or illness which results in complete loss, or	
Disability (PPD)	permanent loss of use, of any part(s) of the body or any permanent	
	impairment of function or parts of body, regardless of any pre-existing	ľ
	disability of the injured member of impaired body function. A PPD is no	-
	related to the ability of the injured person to do is normal work, e.g. it	
	classified as a PPD if he has lost a finger, toe, arm, limb, etc. but (upor	
		I
	recovery) is still able to do his normal work or any other work that	
B 1= 1 1	permits for the partial disability.	
Permanent Total	Any work-related injury or illness, which permanently incapacitates ar	
Disability (PTD)	employee from doing any work and results in termination of employm	
Primary Containment	A tank, vessel, pipe, transport vessel or equipment intended to serve a	
	the primary container for, or used for the transfer of, a material. Prima	ry
	containers may be designed with secondary containment systems to	
	contain or control a release from the primary containment.	
Primary Surface Cause	Most superficial level of cause of an incident (implicating or has poten	nti,
ary Jonace Cause	to implicate) an injury or illness e.g. in case of a fall from a ladder prim	
		ıUl
	surface causes may be defective ladder indicating unsafe condition	
B	and hurriedness of the person indicating unsafe behavior.	
Process Safety Incident	An undesirable event / condition, generally traceable through a trip of	
	alarm via the instrumentation circuit e.g. an unplanned or uncontrolle	b¢
	Loss of Primary Containment (LOPC) from a process, or an undesired	
	event or condition that, under slightly different circumstances, could	

Restricted Workday	A RWC is a work related injury or illness which results in the OGDCL's or		
Case (RWC):	contractor's workforce member being unable; (1) to perform one or more routine duties, or (2) to work the full day on, or the next calendar		
	day after the day of injury/illness. A RWC occurs when the injured person is temporarily assigned to do other, less strenuous work (than the		
	normal job) e.g. an injured maintenance technician doing light office		
	work. This also includes situations where the worker does perform his		
	routine duties but for less period of time than normal shift timings because of restriction of work.		
Root Cause Analysis	A structured process that uncovers the physical, human, and latent		
(RCA) STOP Card	causes of any undesirable event in the workplace.		
SIOP Cara	Influenced by STOP (Safety, Training, Observation and Program) Card, an HSE management tool proposed by DuPont and adopted by		
	OGDCL. By encouraging all the employees to observe, identify and		
	intervene the unsafe acts or accident symptom at workplace, it aims at "instantly" eliminating the hidden dangers and reducing occurrence of		
	accident through small behavior based "on-spot talks" so that job/		
O : 1 D:	work can resume safely.		
Swim Lane Diagram or STEP (Sequential Timed	Tool used to analyze an accident by connecting events to indicate how they prompted a final result. It enables the investigator to build a		
Event Plot) Diagram	graphical timeline and utilize it for further accident assessments		
	techniques.		
	$\sqrt{1}$ $\sqrt{2}$ $\sqrt{3}$

	Unsafe acts to unadate		
	ant		
	10 rabset		
	ERROR Failed of absent defences		
	EKI.		
UBUC	Unsafe Behavior Unsafe Condition.		
Uncontrolled Activity	If an activity is not controlled or monitored, it is an uncontrolled activity.		
	This is an activity where OGDCL does not set or influence HSE policies, standards and procedures (PSP) and does not supervise HSE		
	performance. Incidents arising from uncontrolled activities are neither		
	reported, investigated or tracked; although these incidents should be		
ISK MANAGEMENT	assessed for potential learning that could be applied within OGDCL.		
ALARP	Principle is that the residual risk be reduced as far as reasonably		
(As Low As Reasonably	practicable as any additional cost involved in reducing the risk further		
Practicable) Barrier	would not be proportionate to the benefit gained.		
DUITIEI	Functional grouping of safeguards or hazards or threats control hierarchy selected to prevent or limit the consequences.		
Due Diligence	Process to identify, prevent, mitigate, and account for how the actual		
	and potential negative risks are addressed.		

Enterprise Risk Management (ERM)	Process effected by an entity's Board of Directors, Management and key personnel, applied in business planning, strategy setting, and designed to identify potential events that may affect entity, and manage risks to be within the Risk Appetite, in order to provide reasonable assurance	
ERM Charter	regarding the achievement of organization's objectives. ERM charter is a formal document that outlines Board-Risk Management Committee's structure, responsibilities, authorities and functions.	
External Risk	Risk associated with uncontrollable sources.	
Hazard (Threat/ Cause)	Any process/operation/activity/ object/ substance/ body related event or gap in the protection efforts or source that could potentially trigger damage/ loss and/ or give opportunity for improvement.	
Hazard Communication	Disseminating safety information about hazards in a workplace.	
(HAZCOM)		
Hazards Control Hierarchy (Barriers) (Addendum-D)	 Elimination is removal of hazard by eliminating a requirement to carry out a task, use of a particular equipment or use of a chemical. Substitution is replacement of the material; plant; equipment; process; or work practice with a less hazardous one. Engineering controls reduce the reliance of human factors; engineering controls can be redesign of equipment, redesign of process or increase of automation. Engineering controls also include change in layout, ventilation, guards, enclosures, firewalls etc. Administrative controls are the procedural aspects, such as planned and preventive maintenance, awareness events, policies, Standard Operating Procedures (SOPs), work permit system, job hazards analysis, competence of personnel, etc. Personal Protective Equipment (PPE) is the last and might be the least effective method (to counter OH&S hazards/ threats only) as it relies on human behavior. 	
	Substitution Physically remove the hazard Substitution Replace the hazard Engineering controls Isolate people from the hazard	
	Controls Change the way people work Least Protect the worker with personal	
Risk Assessment Matrix (RAM)	Visualization tool for the graphical presentation of the risks. Also known as Risk Dashboard, Risk Heat Map or Risk Heat Chart, it shows likelihood on	
Response Owner	the horizontal axis (X) and consequence on the vertical axis (Y). An individual or entity who facilitates the Risk Owner in managing a risk.	
Risk Management	Team of domain professionals (subject matter experts) trained on	
Team	Hazard/ Threat Identification & Risk Assessment methodologies/ ESG framework.	
Key Risk Indicators (KRIs)	A Key Risk Indicator (KRI) is a measurable metric used to monitor the potential risks, essentially acting as an early warning system to identify potential issues before they become major problems.	
Residual Risk	Residual risk is the amount of risk that remains after controls are in place or accounted for.	
Risk Mitigation	The mitigation of an "actual" negative risk refers to actions taken to reduce the severity of the negative impact that has occurred, with any residual impact needing remediation. Whereas the mitigation of a "potential" negative risk refers to actions taken to reduce the likelihood	
Risk	of the negative impact occurring. The effect of uncertainty on objectives.	
Risk (Rating)	Numerical value of a risk as combination of an incident-likelihood and	
Positive Risk	consequence-severity within a 5x5 risk assessment matrix. An "opportunity" is considered a positive risk – an event which makes objectives easier than expected.	
Negative Risk	Negative risk is that event which stops or hinders the achievement of objectives. These types of events are considered as "risks".	
Risk Appetite	Level of risk an organization is prepared to accept or tolerate in pursuit of its objectives, before action is deemed necessary to reduce the risk. In a risk appetite scale, these include as Risk seeking, Risk tolerant, risk neutral and risk averse. Risk seeking: Aggressive risk taking is required.	
	Risk tolerant: Greater than normal risk taking is tolerable due to	

	controls/ barriers.	
	Risk neutral: Risking taking is more balanced.	
	Risk averse : Risk must be avoided.	
Risk Assessment	Overall process of estimating the magnitude of risk and deciding whether it is significant.	
Risk Charter	It is a committee charter in a formal written document form outlining	
(Addendum-A)	the intentions of the risk management committee, its authoritative	
Risk Card	powers, and its overall operating structure.	
	Document to describe elements of a significant risk (as recorded in the	
(Addendum-F)	Risk Register) for the sake of mitigation.	
Risk Criteria	Terms of reference which evaluates the significance of a risk as Low = 1-6; Medium = 7-12; High = 13-20; Intolerable = 21-25.	
Risk Management	System to eliminate or mitigate the risks.	
Risk Owner	An individual or entity accountable as well as authoritative to assess and manage a risk.	
Risk Register	A comprehensive document used to scribe and rate potential risks	
(Addendum-B)	along with existing and future controls.	
Risk Source	Element which has potential to give rise to a risk.	
Risk Treatment	Controlling, avoiding or transferring the risk.	
Significant Risk	Intolerable or high risk.	
Threat Control	Methods used to reduce the overall impact of a threat. For example,	
(Addendum-E)	hazards control hierarchy	
	(barriers), training & induction, local development investments &	
	stakeholder initiatives, customer management, recruitment retention &	
	skilled labor, R&D projects, recovery/ emergency plan, automation/	
	digitalization, contract risk management (pre/post award), surveillance	
	& intelligence (security), technological & operational improvements,	
	asset integrity management, strengthening resources & tools, legal	
	defense activities, portfolio management, partnerships for risk	
	management, hedging & factoring, insurance & guarantees, transfer of risk liability contract, sale/ closure of assets, carbon offset, etc.	

SUSTAINABLE DEVELOPMENT

sustainability

sustainability: the state of the global system where the needs of the present are met without compromising the ability of future generations to meet their own needs

greenhouse gas (GHG): both naturally occurring gases like carbon dioxide (CO2), methane (CH4), and water vapor (H2O), and human-made synthetic gases such as hydrofluorocarbons (HFCs)

Note 1: Scope 1 GHG emissions are the direct greenhouse gas (GHG) emissions from a company's own sources, which company owns and has full control over

Note 2: Scope 2 GHG emissions are the indirect emissions from purchased energy for meeting power, cooling, heating requirements, which company has less control over Note 3: Scope 3 GHG emissions are all other indirect emissions from the company's value chain including supply chain, outsourced travel/ transportation, products' use, disposal, etc., which company has almost no control over

greenhouse gas effect: a natural process where the greenhouse gases (GHG) in Earth's atmosphere trap heat from the sun, keeping the planet warm enough to support life.

global warming potential (GWP): a measure of a greenhouse gas's heat-trapping effect compared to carbon dioxide (CO2) over a specific time-period. It is a relative scale where CO2 has a GWP of 1, and gases with higher GWPs, like methane or nitrous oxide, contribute more to global warming per unit of mass emitted than CO2; GWP values are influenced by a gas's ability to absorb infrared radiation and its atmospheric lifetime

scenario analysis: a strategic process where a company assesses how different plausible climate futures could impact its business, and it then discloses its strategy's resilience under these scenarios. It helps businesses identify and manage both physical and transition-related climate risks, test the robustness of different business strategies, and inform stakeholders about the potential financial implications of climate change

natural capital

natural capital: stock of renewable and non-renewable natural resources (e.g. plants, animals, air, water, soils, minerals) of a given quality existing at a point in time that separately or in combination yield a flow of benefits to people

Note 1 to entry: Natural capital includes both living and non-living aspects. It includes biotopes, mountains, fields, forests, meadows, unimproved land, minerals, oceans, glaciers, ice sheets, freshwater, microorganisms, wild fauna and flora, electromagnetic spectrum, and geospatial orbit.

Note 2 to entry: Natural capital underpins all the other forms of capital (social, human, intellectual, financial and manufactured). Natural capital, often in combination with other forms of capital, provides natural capital benefits over time.

Note 3 to entry: Natural capital includes assets owned by an organization, by others, or by no one. Natural capital accounting considers all natural capital assets regardless of ownership.

ecosystem: dynamic complex of communities of plants, animals and micro-organisms and their non-living environment interacting as a functional entity

Note 1 to entry: Examples of ecosystems include deserts, coral reefs, oceans, glaciers, ice sheets, freshwater rivers, lakes, wetlands, rainforests, boreal forests, grasslands, urban parks, and cultivated farmlands. See the Convention on Biological Diversity, Article 2[6], for more examples. Ecosystems can be influenced by human activity.

Note 2 to entry: There are numerous ecosystem classification systems. For example, the International Union for Conservation of Nature Global Ecosystem Typology (IUCN GET)[7] accommodates unique local ecosystem types and integrates all ecosystem types globally into a single structure. Most countries, and often subnational regions, have ecosystem classifications.

Note 3 to entry: People are part of ecosystems and, like all other living organisms, affect the processes taking place, as well as deriving benefits from them.

ecological service: benefit people obtain from one or several ecosystems

Note 1 to entry: Ecosystem services classification systems help collate data that can be used across natural capital accounts. There are currently several prominent ecosystem services classifications: the Common International Classification of Ecosystem Services (CICES) (version 5.1 or higher)[8], the United States Environmental Protection Agency (USEPA) National Ecosystem Services Classification System (NESCS)[9], Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES)[10] and the United Nations System of Environmental-Economic Accounting (UN SEEA), Chapter 6[11].

natural capital benefit: good or service derived from natural capital that are used and appreciated by people and which contribute to individual and societal well-being (human welfare)

Note 1 to entry: Natural capital benefits can result from current or future use or appreciation of natural capital and the knowledge that it exists, i.e. use and non-use motivations.

Note 2 to entry: Natural capital benefits include ecosystem services and benefits from abiotic elements of nature.

Note 3 to entry: It is acknowledged that natural capital can also provide disservices or disutilities such as pests (e.g. vector-borne disease, mosquitos, ticks) and pollution (e.g. natural arsenic in groundwater, areas with naturally higher ionizing radiation).

biodiversity: variability among living organisms on the earth, including the variability within and between species, and within and between ecosystems

natural capital account

natural capital account: statement relating to natural capital benefits and natural capital values showing the impacts and dependencies of an organization or its value chain on natural capital and costs

Note 1 to entry: The natural capital account is prepared according to the procedure specified in this document.

Note 2 to entry: Natural capital accounts comprise either a natural capital income statement or a natural capital balance sheet, or both, each with supporting schedules.

natural capital income statement: statement showing the increases and decreases in natural capital benefits related to the activities within the chosen natural capital account scope during the natural capital accounting period

natural capital balance sheet: statement showing natural capital values and costs related to the activities within the chosen natural capital account scope during the natural capital accounting period

natural capital accounting: process of creating a natural capital account

natural capital accounting period: time period during which the activities of an organization occur or are projected to occur for which impacts and dependencies on natural capital are quantified

Note 1 to entry: The natural capital accounting period for the natural capital income statement is the organization's financial reporting period. The natural capital income statement includes impacts in the impact horizon and dependencies in the dependency horizon. The same reporting date is applied to increases and decreases in natural capital benefits.

Note 2 to entry: The natural capital accounting period for the natural capital balance sheet is determined by the lifetime of the natural capital, changes in natural capital and the planning horizon of the organization. The natural capital balance sheet includes impacts in the impact horizon and dependencies in the dependency horizon.

Note 3 to entry: The reporting date for both the natural capital income statement and natural capital balance sheet is the end date of the organization's financial reporting period. The same reporting date is applied to natural capital values and costs.

organization: person or group of people that has its own functions with responsibilities, authorities and relationships to achieve its objectives

Note 1 to entry: The concept of an organization includes, but is not limited to sole-trader, company, corporation, firm, enterprise, authority, partnership, charity or institution, or part or combination thereof, whether incorporated or not, public or private.

Note 2 to entry: Organization in this document can refer to the organization commissioning the natural capital account or the organization whose impacts and dependencies on natural capital are assessed, i.e. the organization that is the subject of the natural capital

account. The two can be the same.

organizational scope: impacts and dependencies of an organization's activities on natural capital

Note 1 to entry: Any operation that the organization owns, controls or for which it has legal or voluntary responsibility are included in the organizational scope.

value chain: entire sequence of activities or parties that create or receive value through the provision of a good or service

Note 1 to entry: Value includes both market and non-market values.

Note 2 to entry: Value chain includes the activities of suppliers (raw and produced inputs and services), activities over which the organization has direct operational control and activities linked to the purchase, use, reuse, recovery, recycling and final disposal of the organization's goods and services.

value chain scope: impacts and dependencies of an organization's value chain on natural capital regardless of ownership

Note 1 to entry: The impacts and dependencies included are directly associated with an organization's activities, including material upstream or downstream impacts and dependencies. For example, water abstraction by the organization can rely on a water catchment that the organization does not have responsibility for or own. Even then, the impacts of abstraction on natural capital and other water users are included in the natural capital account.

extended value chain scope: impacts and dependencies on natural capital (regardless of ownership) due to activities inside or outside the value chain that are affected by an organization's activities

Note 1 to entry: The impacts and dependencies included in a natural capital account can be directly associated with the organization's activities, induced by them or market driven. For example, the impacts of sourcing water can be limited to the process through which an organization sources the water or can be extended to assess implications in the market such as the use of a marginal unconstrained technology (e.g. a desalination plant).

interested party

stakeholder: person or organization that can affect, be affected by, or perceive itself to be affected by a decision or activity

Note 1 to entry: An organization can undertake a distributional analysis to see which interested parties benefit or lose as a result of the activities within the chosen scope.

release: emission to air or discharge to water or soil

impact: change to natural capital, whether adverse or beneficial, wholly or partially resulting from the activities, goods or services of an organization, its value chain or its extended value chain

Note 1 to entry: Change in natural capital due to the impacts of an organization affects the organization and others who depend on that natural capital.

impact pathway: series of consecutive, causal relationships, starting at an activity and ending at an impact

Note 1 to entry: For example, an impact pathway can link the emission of pollutants to air to resulting changes in concentrations in the atmosphere, concentrations to depositions, and to impacts on health, materials, vegetation, and other receptors as relevant.

impact horizon: time period over which the impacts are considered

Note 1 to entry: The activities of an organization are those that fall within the natural capital accounting period.

Note 2 to entry: The impact horizon can span multiple years and varies by activity, and the specific releases and resource uses associated with a given activity. For example, combustion of fossil fuels and also of biomass can lead to emissions in terms of heavy metals and particulate matter. Heavy metals can stay in the biosphere for decades to centuries during which they can impact living organisms, while particulate matter stays in the atmosphere for hours to days. Therefore, an upper limit for the impact horizon is considered to be in the order of decades, centuries or millennia.

dependency: reliance on, or use of, natural capital by an organization, its value chain or its extended value chain

Note 1 to entry: Reliance means different things to different organizations and can include revenue generation, operational continuity, cost management, reputation, delivering non-financial objectives and responsibilities.

dependency pathway: causal relationship starting at an environmental condition and ending at an effect on an organization

Note 1 to entry: Natural capital provides multiple benefits including ecosystem services. There is not a single linear relationship between quality and quantity of natural capital and natural capital benefits. There can be many possible and nonlinear combinations.

dependency horizon: time period over which dependencies are considered

Note 1 to entry: The dependency horizon is determined by the lifetime of the natural capital, changes in natural capital and the planning horizon of the organization. It is the same as the natural capital accounting period for both the natural capital income statement and natural capital balance sheet noting that the organization that is the subject of the natural capital account is dependent on natural capital only when it is active.

Note 2 to entry: Costs in both the natural capital income statement and natural capital balance sheet are also quantified over the same dependency horizon.

Note 3 to entry: The dependency horizon can span multiple years. The natural capital the organization, its value chain or its extended value chain depends on can change over the dependency horizon. For example, the energy transition from fossil fuels to renewable energy sources means that the dependency on the former reduces over time and can even stop at one point, while the dependency on the latter increases or can potentially only start at some point in the future (i.e. the related dependency does not exist yet). Therefore, a dependency on a given natural capital can be shorter than the natural capital accounting period.

natural capital value: present value of annual monetary values, incorporating natural capital benefits over the dependency horizon and impacts over the impact horizon related to the activities within the chosen scope during the natural capital accounting period of the natural capital balance sheet

Note 1 to entry: Natural capital values are shown in the upper part of the natural capital balance sheet.

cost schedule: schedule showing maintenance or production costs

Note 1 to entry: To avoid double counting, activities that can both restore, maintain or enhance natural capital and produce market and non-market goods and services are costed only once.

Note 2 to entry: Cost schedules input into the lower part of the natural capital balance sheet.

maintenance cost schedule: schedule of costs for activities that are undertaken, committed or projected to restore, maintain or enhance the quality or quantity of natural capital

production cost schedule: schedule of costs for activities that are undertaken, committed or projected to produce market and non-market goods and services

natural capital accounting

base case scenario: projection of future flows of natural capital benefits and production and maintenance costs across the natural capital accounting period of a natural capital balance sheet based on the best information available to the organization

Note 1 to entry: As much as possible, the definition of base case scenario captures the changes in the quality or quantity of natural capital, including cumulative impacts of the organization's activities and the resulting changes in natural capital benefits. The changes can reflect past performance and known or expected trends. Trends can be influenced by, among other factors, pending regulations, organizational commitments, changes to the organization's activities, the activities of its value chain and wider environmental and social influences such as climate change or demographic change.

Note 2 to entry: The user of this document can compare different future scenarios to see the implications of actions that the organization considers taking or to test key assumptions.

discount rate: percentage rate at which monetary values at different future times are converted to

the present value

materiality: relevance and significance with respect to the decision context

Note 1 to entry: Both financial and impact and dependency information can be material when assessing relevance and significance.

impact materiality (the "inside-out" view): This perspective considers the positive and negative effects of a company's activities on society and the environment. This includes issues like carbon emissions, labor practices, biodiversity loss, and human rights across its entire value chain.

financial materiality (the "outside-in" view): This perspective focuses on how sustainability issues create financial risks and opportunities that affect the company's development, financial performance, and long-term value. Examples include the financial risks of new carbon taxes, supply chain disruptions from extreme weather, or opportunities for new sustainable products.

present value: sum of expected positive or negative flows of future monetary values that have been discounted to bring them to today's value using a discount rate

price year: year for which monetary data are valid

Note 1 to entry: The price year is usually the year for which present value is calculated.
